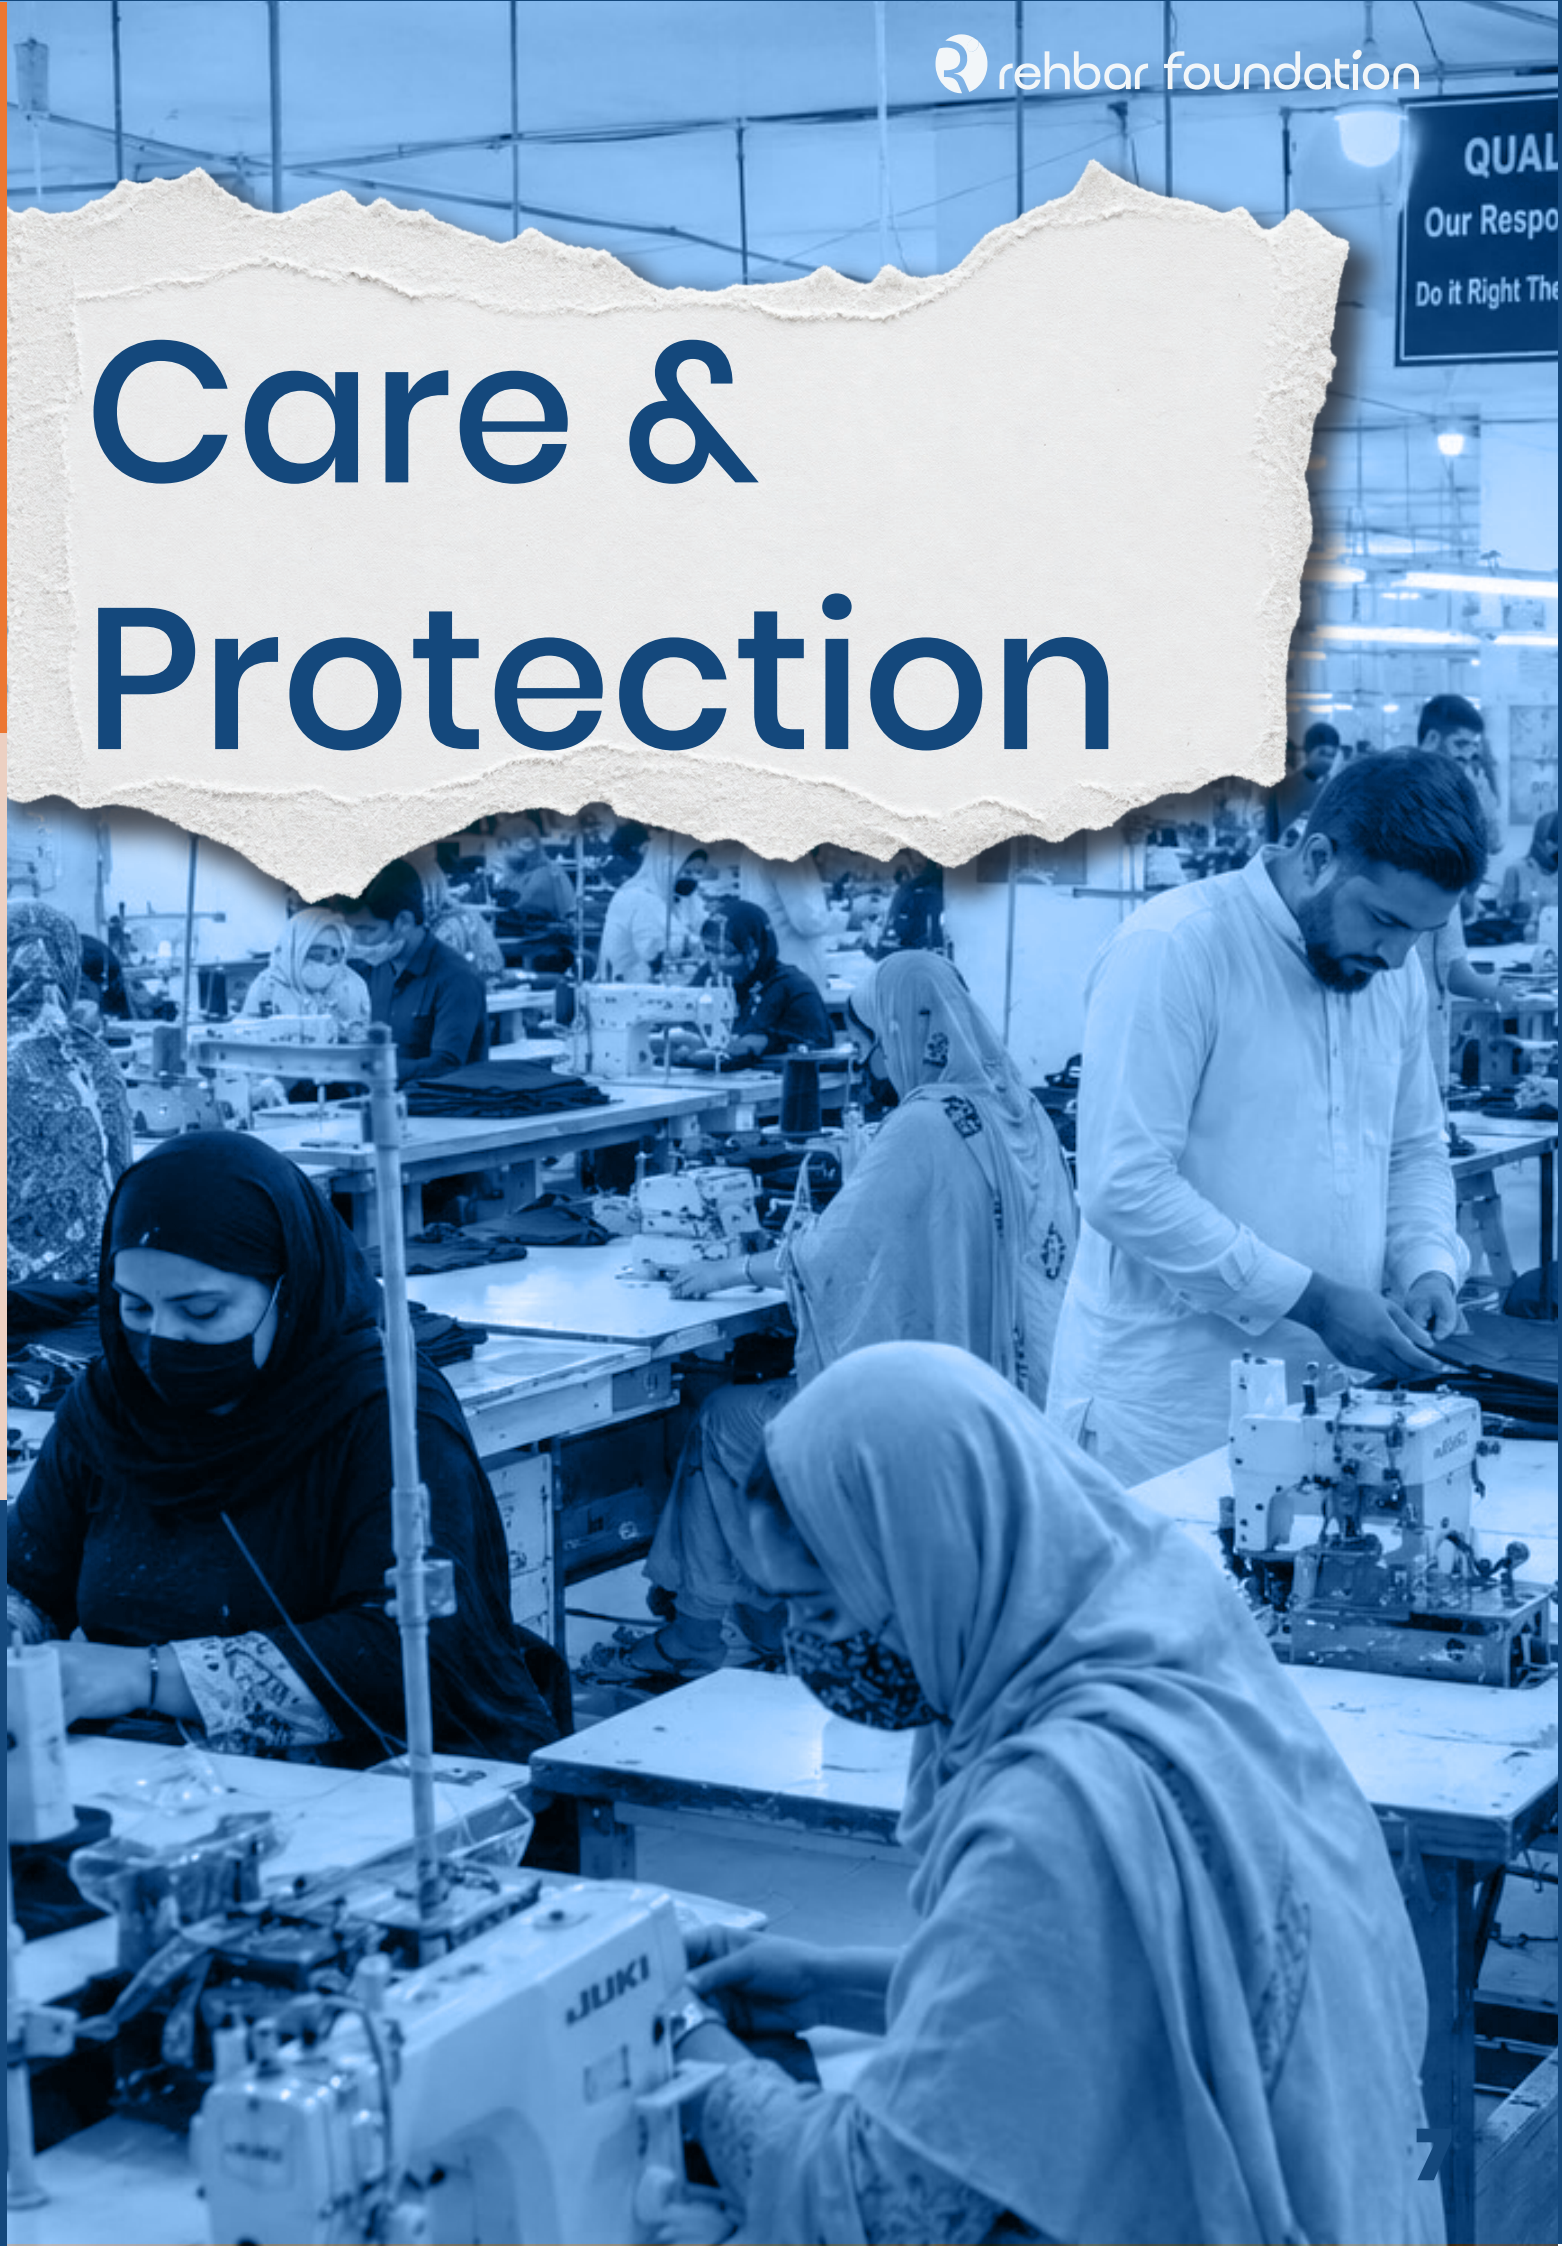
Care & Protection



Work should provide a livelihood without putting people's health, safety, or wellbeing at risk.

Rehbar's Care & Protection work focuses on the conditions that allow workers and their families to live and work safely. This includes occupational health and safety, access to basic healthcare, emergency support, and care infrastructure that helps working parents, particularly women, remain in the workforce.

How It Works

1. Build safer work practices

We provide occupational health and safety training across agricultural and factory settings.

Workers learn how to identify hazards, use protective equipment, and apply safer practices in their everyday work.

2. Bring basic healthcare closer

We organise health screening and basic treatment at worksites and within worker communities, with referrals to appropriate services when further care is needed.

3. Respond when emergencies happen

Floods, heatwaves, and other climate related emergencies can quickly disrupt health, income, and access to basic services. We support affected workers and communities with timely emergency relief where needed.

4. Strengthen care around the workplace

We support safe and accessible childcare close to worksites, helping working parents care for their children while maintaining their livelihoods. This can also reduce some of the unpaid care burden that falls disproportionately on women.

Who it's for

Workers and their families across agricultural and industrial settings, particularly communities where access to occupational safety measures, healthcare, childcare, or emergency support is limited.

Why it matters

Safety is part of a person's ability to work, earn, and live with dignity.

For many workers, the risks they face do not stop at the workplace. Health needs, care responsibilities, emergencies, and unsafe working conditions can all affect whether someone is able to keep working and support their family.

Care & Protection brings these realities into the way we design support for workers and their communities.
