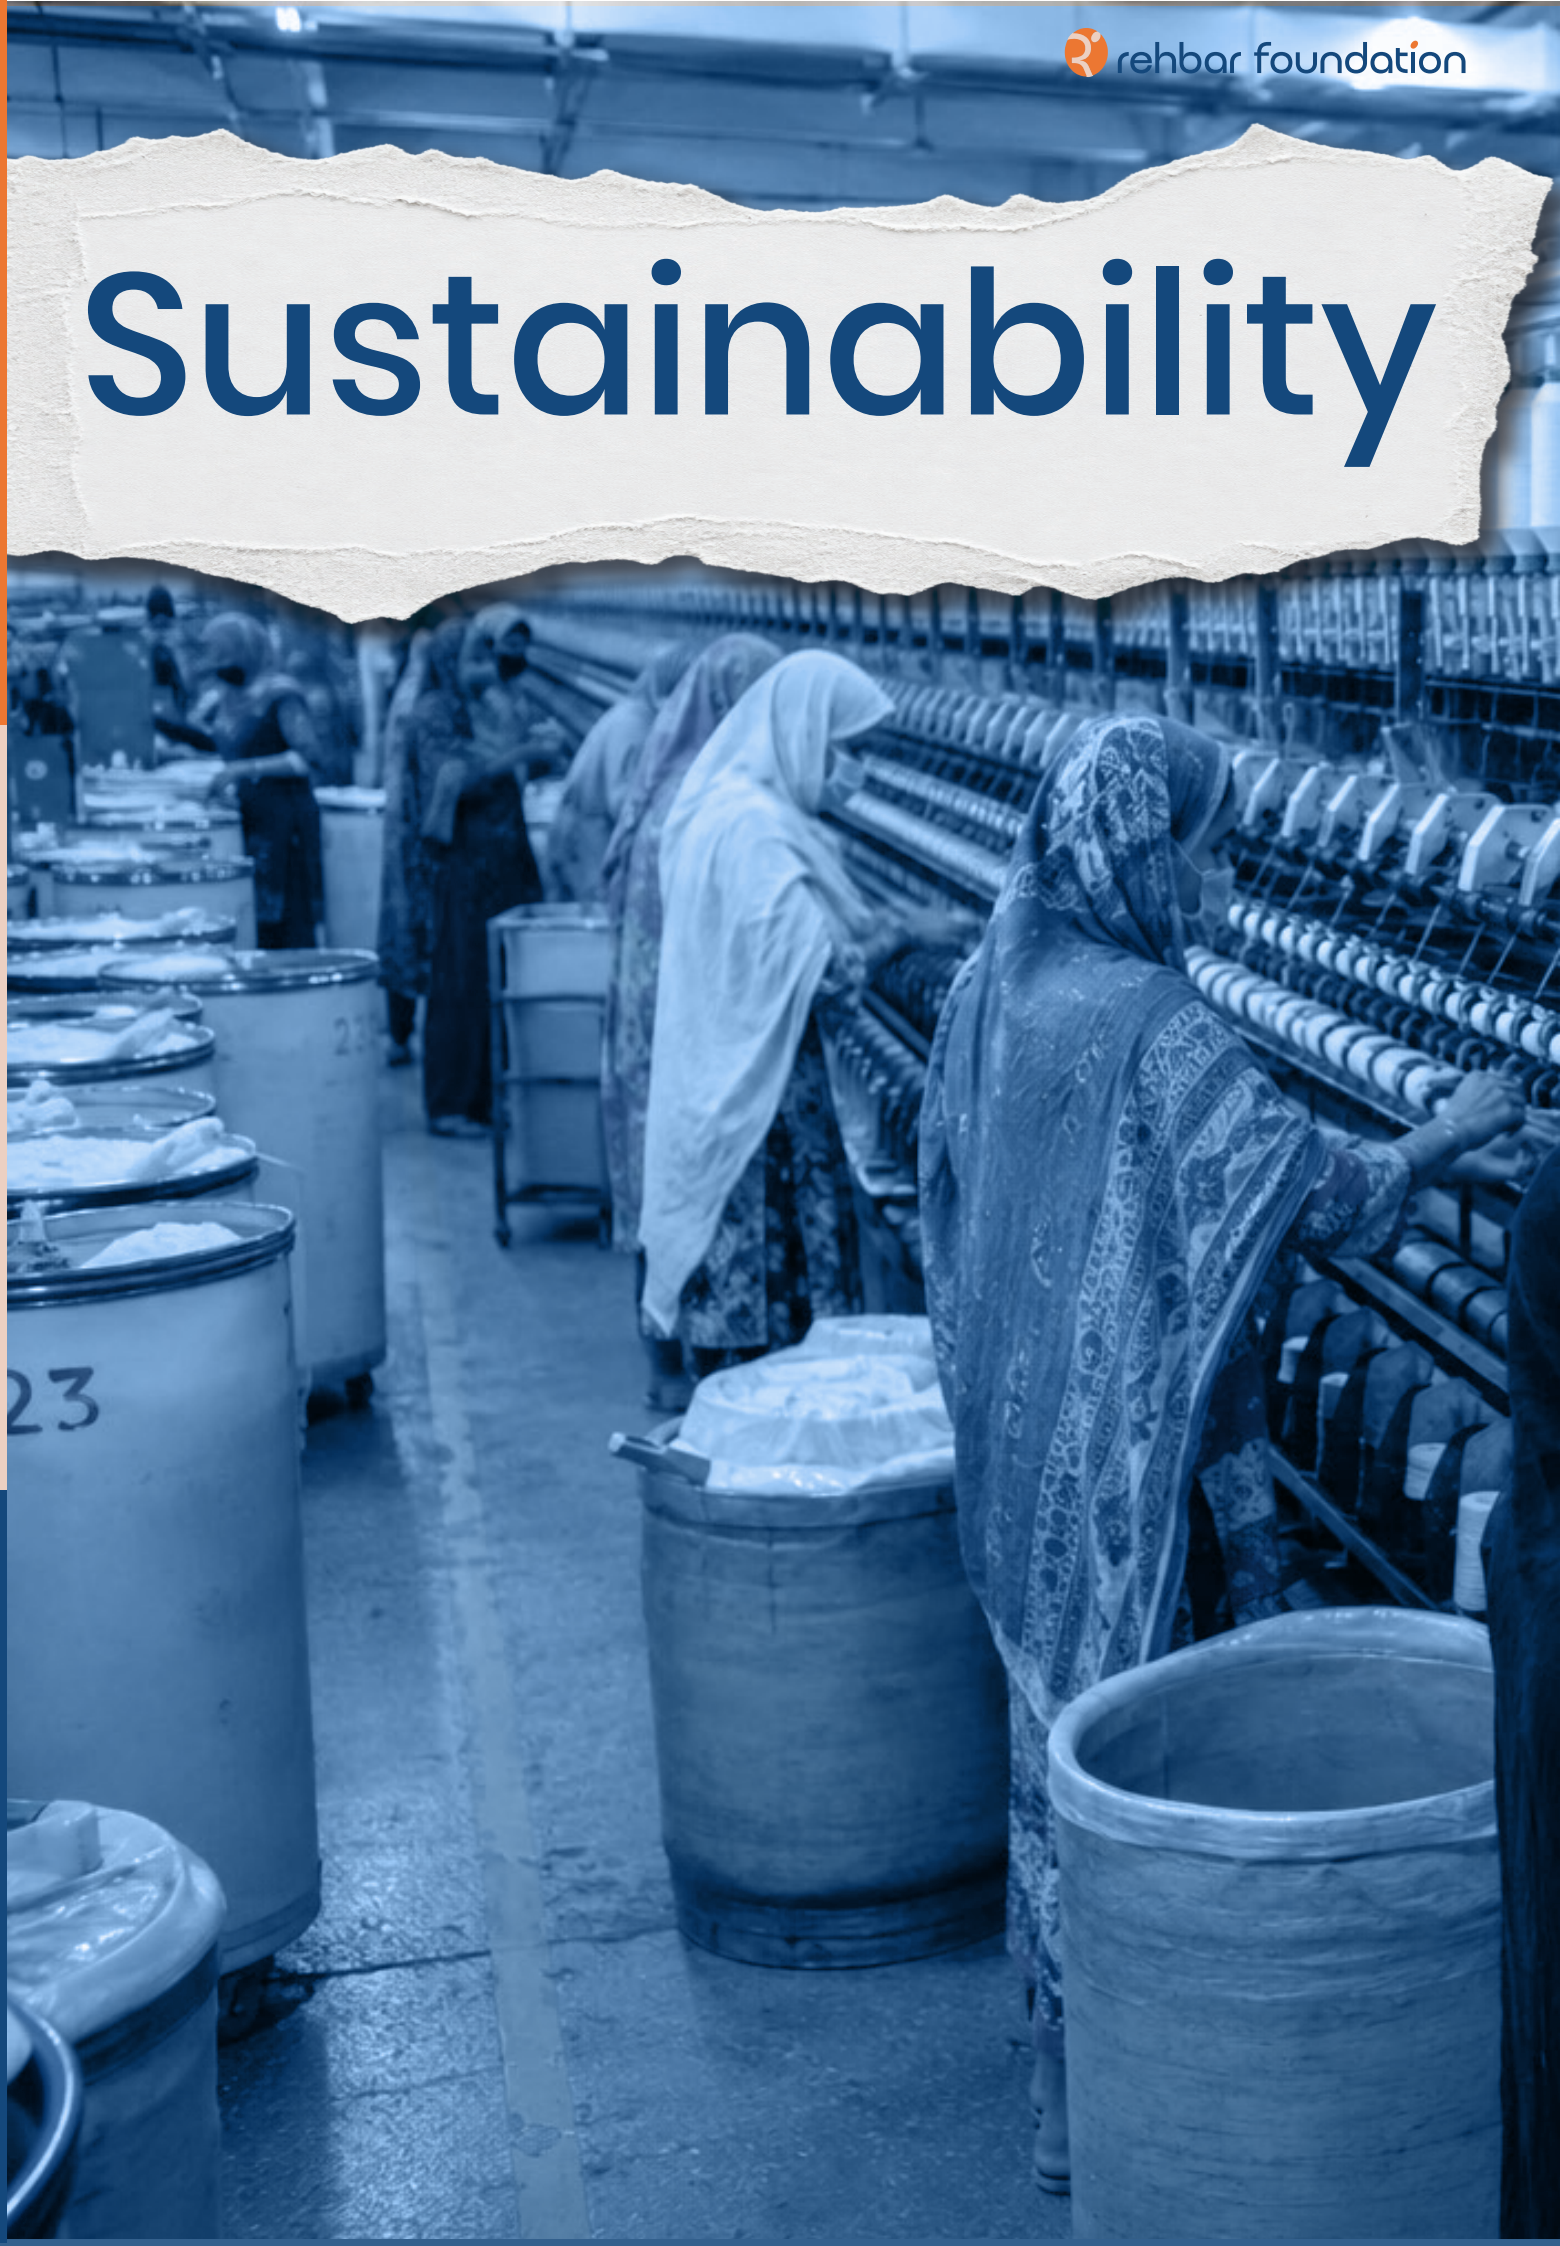
Sustainability



Pakistan's climate and environmental pressures are already affecting the people whose work sustains agriculture and industry.

Farmers are facing greater uncertainty around water, weather, crops, and incomes. Across industry, the shift towards cleaner and more resource-efficient production will change the way businesses operate and the skills workers need. These changes need to account for the people whose livelihoods depend on these systems.

Rehbar's Sustainability work connects climate action with worker and livelihood resilience.

How It Works

1. Support climate resilient livelihoods

We work towards approaches that help farmers manage climate pressures through more resilient crops and improved land and water management, reducing exposure to the risks that can threaten household incomes.

2. Support a fairer industrial transition

We engage with the transition towards lower-carbon and more sustainable production, with attention to the workers whose jobs and livelihoods are connected to existing production systems.

3. Mobilise resources for transition

Sustainable change often requires investment that individual communities or businesses cannot carry alone. We explore financing approaches that bring public, private, and development resources together to support practical climate action.

4. Strengthen systems and accountability

Climate programmes need credible systems to show whether commitments are being delivered. Our work includes strengthening monitoring, reporting, and verification so that climate investments and interventions can be tracked more effectively.

Who it's for

Farmers, agricultural workers, factory workers, and communities whose livelihoods are exposed to climate and environmental pressures. We also work with businesses, public institutions, development partners, and other actors involved in Pakistan's transition towards more sustainable production.

Why it matters

Climate change is already a livelihood issue.

The move towards a more sustainable economy needs to protect the people whose work and incomes are tied to the systems being changed. For Rehbar, sustainability means building environmental resilience alongside secure livelihoods, decent work, and stronger systems for the future.
